## SENDGRID INTEGRATION WITH PYTHON CODE

| TEAM ID      | PNT2022TMID21435                   |
|--------------|------------------------------------|
| PROJECT NAME | NUTRITION ASSISTANT<br>APPLICATION |

### STEP 1:

**REQUIREMENTS:** 

PYTHON 2.6,2.7,3.4 OR 3.5

#### **STEP 2:**

CREATE AN API KEY

### **STEP 3:**

INSTALL PACKAGE: > pipinstallsendgrid

#### **STEP 4:**

#### SEND EMAIL

```
## first Selection View Go Run Terminal Help wendystivergationapy - Visual Studen Code

| Date | Communication | Communication
```

## **SENDGRID PYTHON CODE:**

```
import os
2 from sendgrid import SendGridAPIClient
  from sendgrid.helpers.mail import Mail
4
5
  message = Mail (
6
       from email='from email@example.com',
7
       to emails='to@example.com',
8
       subject='Sending with Twilio SendGrid is Fun',
       html_content='<strong>and easy to do anywhere, even with
   Python</strong>')
10 try:
11
       sg = SendGridAPIClient(os.environ.get('SENDGRID API KEY'))
12
      response = sg.send(message)
13
      print (response.status_code)
14
      print (response.body)
      print(response.headers)
15
16 except Exception as e:
17
      print (e.message)
```

# HTTP CLIENT PROGRAM

```
1 """HTTP Client library"""
2 import json
3 import logging
4 from .exceptions import handle_error
5
6 try:
7  # Python 3
8  import urllib.request as urllib
9  from urllib.parse import urlencode
10  from urllib.error import HTTPError
11 except ImportError:
12  # Python 2
```

```
17 _logger = logging.getLogger(__name_)
      def __init__(self, response):
          :param response: The return value from a open call
                           on a urllib.build opener()
          :type response: urllib response object
          self._status_code = response.getcode()

                   url path=None,
                   append_slash=False,
          :param host: Base URL for the api. (e.g.
  https://api.sendgrid.com)
          :type host: string
          :param request headers: A dictionary of the headers you want
```

```
applied on all calls
           :type request headers: dictionary
           :param version: The version number of the API.
                           Subclass build versioned url for custom
  behavior.
                           Or just pass the version as part of the URL
                           (e.g. client. ("/v3"))
           :type version: integer
           :param url path: A list of the url path segments
           :type url path: list of strings
          self.request headers = request headers or ()
           self. url path = url path or []
          self.append slash = append slash
          self.timeout = timeout
               Or just pass the version as part of the URL
104
               (e.g. client. ('/v3'))
            :param url: URI portion of the full URL being requested
            :type url: string
            return '()/v()()'.format(self.host, str(self. version),
  url)
110
        def build url(self, query params):
111
112
113
114
            :param query params: A dictionary of all the query
```

```
parameters
            :type query params: dictionary
            ur1 = ""
118
            while count < len(self. url path):
                url += '/()'.format(self._url_path[count])
121
122
123
124
            if self.append slash:
126
127
            query params:
                url values = urlencode(sorted(query params.items()),
130
131
132
133
                url = self._build_versioned_url(url)
134
135
136
137
138
        def update headers(self, request headers):
139
140
            :param request headers: headers to set for the API call
142
            :type request headers: dictionary
144
145
            self.request headers.update(request headers)
147
```

```
148
            :param name: Name of the url segment
           :type name: string
            url path = self. url path + [name] if name else
  self._url_path
                          request headers=self.request headers,
                          url path=url path,
                          append_slash=self.append_slash,
        def _make_request(self, opener, request, timeout=None):
            :param opener:
            :type opener:
            :param request: url payload to request
            :type request: urllib.Request object
            :param timeout: timeout value or None
            :return: urllib response
174
                return opener.open(request, timeout=timeout)
178
                 logger.debug('(method) Response: (status)
```

```
method=request.get method(),
                    status=exc.status code,
                    body=exc.body))
               (e.g. /your/api/(variable value)/call)
               Another example: if you have a Python reserved word,
190
              in your url, you must use this method.
            :param name: Name of the url segment
            :type name: string
195
196
        def getattr (self, name):
               (e.g. client.name.name.method())
               You can also add a version number by using
   .version(<int>)
            :param name: Name of the url segment or method call
204
            :type name: string or integer if name == version
               def get version(*args, **kwargs):
209
                   :param args: dict of settings
211
                    :param kwargs: unused
```

```
213
                    self. version = args[0]
215
216
                return get version
217
219
            if name in self.methods:
                method = name.upper()
                def http request (
223
                        request body=None,
224
                        query params=None,
                        request headers=None,
                        timeout=None,
227
229
                    :param timeout: HTTP request timeout. Will be
 propagated to
230
                        urllib client
231
                    :type timeout: float
232
                    :param request headers: HTTP headers. Will be
  merged into
233
                        current client object state
234
                    :type request_headers: dict
235
                    :param query params: HTTP query parameters
236
                    :type query_params: dict
237
                    :param request_body: HTTP request body
238
                    :type request body: string or json-serializable
239
                    :param kwargs:
240
241
242
                    ! request_headers:
```

```
243
                        self. update headers (request headers)
244
245
                    if request body is None:
                        data = None
246
247
249
